PREFACE

The 3rd FIRST 2019 (Forum in Research, Science, and Technology) International Conference was initiated and organized by State Polytechnic of Sriwijaya in collaboration with Management and Science, University (MSU), Malaysia and National Chin-Yi University of Technology, Taiwan. The theme of the conference was “Integration of Advanced Technology to Enhance Social Welfare”. The 3rd FIRST 2019 International Conference facilitated the participants from all over the world to meet face to face to open chances in establishing connection and collaboration among them. It was not only for the researchers in academics, but also in industries and governments. This conference became an effective media to link the researchers from many parts of the world conference, for exchanging, sharing, following up and discussing the results of the latest research, industry's needs, and government regulatory policies. The 3rd FIRST 2019 International Conference became worthwhile platform for researchers to present their finding in the areas on multidisciplinary of Engineering and Science (Track 1), Computer Science and ICT (Track 2), and Social Science (Track 3). It has also provided an opportunity for the professionals and researchers to learn and share about the latest development and research in those 3 tracks.

The 3rd FIRST 2019 International Conference attracted so many authors not only from Indonesia but also from other countries, such as Japan, Taiwan, and Malaysia. There were 180 papers were accepted in the 3rd FIRST 2019 International Conference, including 89 papers for Track 1 (Engineering and Science), 46 papers for Track 2 (Computer Science and ICT), and 45 papers for Track 3 (Social Science). In The 3rd FIRST 2019 International Conference, there were 4 keynote speakers and 2 invited speakers. As the keynote speakers, there were Prof. Yasushi Kiyoki, Ph. D from KEIO University, Japan, Prof. Nurul Taufiq Rochman, M. Eng, Ph. D, From LIPI, Indonesia, Prof. Tjiptohadi Sawarjuwono, M. Ec., Ph. D., Ak, from Universitas Airlangga, Indonesia, and Prof. Win-Jet Luo, from National Chin-Yi University of Technology, Taiwan. As the invited speakers, there were Dr. R. Wisnu Nurcahyo, DVM from Universitas Gadjah Mada, Indonesia, and Assoc. Prof. Dr. Intan Zaurah binti Mat Darus from Universiti Teknologi, Malaysia. The 3rd FIRST 2019 International Conference committee would like to say thank you very much for all the participants and their respected institutions that have supported for the success of the 3rd FIRST 2019 International Conference, and also for all of the guess and sponsors of the 3rd FIRST 2019 International Conference.

ABSTRACT

Additive Manufacturing (AM) is a breakthrough in manufacturing technology based on a layer by the layer printing process through various raw material input techniques. Objects to be printed using a 3D model design by adding raw materials to a 3D printing machine are opposite to subtractive manufacturing types, such as in a CNC milling machine. The purpose of this study was to obtain optimal parameters on the DLP type 3D printing machine for product roughness values using methods that include literature, design, and experimental studies. The specimens tested were 30x15x4 mm in size, with ultraviolet resin material. The test results were analyzed based on the 2-level factorial experimental design type and the 3FI design model, which was processed using the Anova method. The analysis results show that the optimal parameter for the DLP type 3D printing machine for the product surface roughness is the layer height; 0.035 mm, exposure time; 19.542 s, and bottom exposure; 60.679 s with a roughness value of 0.469 μm .

Keywords: additive manufacturing, 3D printer, DLP, anova, resin, surface roughness

1. INTRODUCTION

An object fabrication method using additive manufacturing (AM) based 3D printing machines have been developed. This method can overcome the weakness in the complexity of 3D structures that still rely on the traditional way by hand. This prefabrication method involves integrating computer-aided design (CAD) and computer-aided manufacturing (CAM) based designs to make objects or products with complex structures. Object dimensions can be made accurately. One of AM's main advantages depends on its ability to handle 3D structures' complexities because the AM method can be developed from solid, liquid, and powder materials. Objects are produced directly from a three-dimensional digital model by gradually adding raw materials.

Currently, AM is increasingly being used for applications in the health sector. While it is impractical to produce large-scale objects, AM can be a perfect fit

for all applications that require a high degree of individual customization. For example, in the health sector, doctors use it to make samples of human organs as a pre-operative planning tool to help them visualize and plan the work of organs before the actual operation.

Apart from advances in AM technology, there are still many challenges, especially regarding raw materials, resolution, tolerance, and surface roughness. Among the AM technologies, digital light processing (DLP) is one of the most promising technologies and is partially used in anthropotomy. DLP is a process in which a liquid photopolymer in vat resin is selectively solidified by polymerization exposed to ultraviolet (UV) light. This technology is characterized by a high level of surface quality and accurate dimensions.

Surface roughness is an essential factor of a product's surface because it determines whether the machine elements can adequately measure a product's quality. A lousy surface roughness level will cause various problems such as wear and cracks, so it is

necessary to know the effect of machining parameters to get a good surface roughness value. There are two basic parameters of DLP type 3D printing machines, that is recoat and scanning parameters. This fundamental parameter is further divided into several parts, that is layer height, exposure time, bottom exposure, the light of the delay, bottom layers count, lift distance, lift speed, and retract speed. Selection is a very influential part of each layer's accuracy and surface roughness during the printing process.

This study aims to obtain a good roughness value for 3D printing machine products by getting optimal parameters on the DLP type 3D printing machine for the product roughness value using methods that include literature, design, and experimental studies.

2. LITERATURE REVIEW

Computer-aided design (CAD) uses computers to help create, modify, analyze, or optimize related designs. CAD software is used to increase productivity, improve the quality of designs, and improve communication through documentation. In mechanical design, it is known as mechanical design automation (MDA) or computer-aided drafting (CAD), which includes the process of making engineering drawings using computer software such as Autodesk Inventor, Pro/ENGINEER, SolidWorks, and SketchUp Pro [1].

3D Printing Machine is a form of additive manufacturing in which a three-dimensional object is formed by adding raw materials layer by layer [2]. The first step of a 3D printing machine is to create a digital model of the object printed [3-5].

The American Society for Testing and Materials (ASTM) publishes classification standards for the Additive Manufacturing process into seven categories. This classification standard aims to clarify and differentiate between one type of processing technique and another. The seven categories are; (1) Binder Jetting, (2) Directed Energy Deposition (DED), (3) Material Extrusion, (a) Fused Deposition Modeling (FDM), (b) Fused Filament Fabrication (FFF), (c) Contour Crafting. (4) Jetting Materials, (5) Fusion Powder Bed; (a) Selective Laser Sintering (SLS), (b) Direct Metal Laser Sintering (DMLS), (6) Sheet Lamination, and (7) Vat Photopolymerization; (a) Stereo Lithography (SLA), (b) Continuous Liquid Interface Production (CLIP), (c) Digital Light Processing (DLP) [5].

The quality of a product that is considered acceptable is usually characterized by good surface quality. The level of surface roughness significantly affects the quality of the 3D printed product in the Digital Light Processing (DLP) method, mostly when the printed components are used in the assembly that requires high accuracy, in testing mechanical properties,

and in joining components that require component dimensional accuracy [6].

From various previous studies on the product surface roughness value on a 3D printing machine, the conclusions were obtained is the roughness value obtained from the best results with a roughness value of $8.55 \mu\text{m}$ from the first experiment on the 4th side and the average roughness obtained on each side is $11 \mu\text{m}$ [7]. The more extensive the layer used, the value The surface roughness is also getting bigger, and vice versa, with the conclusion that ABS polymer with horizontal orientation is the best result for the surface roughness test [8].

3. MATERIALS AND METHOD

The method used in this research includes literature, design, and experimental studies of the DLP-type 3D printing machine. In this study, a DLP type 3D printing machine that uses resin raw materials is used; using resin raw materials is due to the complex structure, object detail, and roughness level of the 3D printing machine. The test is carried out by making a test specimen measuring $30 \times 15 \times 4$ (see Figure 1). This test aims to obtain parameter optimization in the DLP type 3D printing machine production process on the product surface roughness value to produce the product according to the design. Also, the resulting data will be analyzed using Anova. In making the DLP type 3D printing machine test specimen, there are three stages: designing a 3D model using CAD software, slice and export 3D models using Chitubox software, and making a 3D model object of a test specimen printed with a DLP-type 3D printing machine.

In making test specimens, fixed-parameter factors (see Table 1) and control parameters (see Table 2) were determined.

Table 1 Fixed parameter factors

No.	Parameter	Value	Unit
1	Light-off (Delay)	0	(s)
2	Bottom Layers Count	3	-
3	Lift Distance	5	(mm)
4	Lift Speed	65	(mm/min)
5	Retract Speed	150	(mm/min)

Table 2 Controlled parameter factors

Parameter	Lower	Upper	Unit
Layer Height	0.035	0.05	(mm)
Exposure Time	14	20	(s)

Next, the data obtained from the test results were analyzed by Anova, which analyzes the differences between the group means in the sample and test the hypothesis (H_0) that the average of two or more populations is the same. The Anova concept is based on the F distribution concept and can be applied to analyze the relationship between various observed variables [9].

In this research, the tools and materials used are; Autodesk Inventor Pro 2020 student version, Chitubox software version 1.6.5 as a central control and slicer system, Design of expert trial version software, DLP type 3D printing machine, Laptop, Surface Roughness Testers, and Resin.

4. RESULTS AND DISCUSSION

After the testing process is carried out on the test specimens, the data from the measurement results are analyzed to determine the factors that affect the layer height, exposure time, and bottom exposure. The parameter combination can be determined to obtain the optimal parametric roughness value using a DLP type 3D printing machine.

To determine the effect of factors on the specimen's response value, analysis of the roughness test results using Anova with the experimental method two level factorial design, using three factors and one response. The specimen testing was carried out randomly according to the measurement design matrix in Table 3 and Table 4, with two replications resulting in 16 test specimens. After the testing process is carried out on the test specimen (see Figure 2), the test results obtained the average value and standard deviation of each response (see Table 5), and the factors on the test are shown in Table 4.

To identify the effect of layer height, exposure time, and bottom exposure factors and determine the optimal combination of values for the test specimens' surface roughness, analysis of the test results data was carried out using Anova. It is known that the hypothesis (H_0) tested is that there is an influence of factors on the roughness of the test specimen, as shown in Table 6.

From the results of the analysis shown in Table 6, it is known that the value of F Value > F Table so that H_0 is rejected. The most significant F value is the layer

height factor, which indicates that this factor significantly affects the roughness test on the product surface.

After the testing and data processing have been carried out, optimization is carried out to determine the optimal value conditions for the layer height, exposure time, and bottom exposure. Specimens were made using a DLP type 3D printing machine, the minimum, maximum, and target levels of each factor and the specified response. The solution to getting the desired optimal value from the response with the factors determined based on the two factorial levels experimental method and the 3FI design model processed using the Anova method can be seen in Table 8 with the factor conditions shown in Table 7. The selected parameters' combination is layer height; 0.035 mm, exposure time; 19.542 s, and bottom exposure; 60.679 s. Option number 3 is made due to the size accuracy of the layer height parameter.

5. CONCLUSIONS

In this study, it can be concluded that:

- 1) The combination of optimization factors is obtained: layer height; 0.035 mm, exposure time; 19.542 s, and bottom exposure; 60.679 s with a roughness value of 0.469 μm .
- 2) The DLP type 3D printing machine can make a product with a high degree of accuracy and precision with detailed complex structure and smooth surface.
