# **FOREWORD FROM GENERAL CHAIR 4<sup>th</sup> FIRST 2020 INTERNATIONAL CONFERENCE**

Assalamu'alaikum wr wb,

Thank to Allah SWT, the most gracious, the most merciful, and may prayers and peace be upon our prophet, Muhammad SAW and upon his companions

First of all, I also would like to say thank you very much for choosing FIRST 2020 and SNAPTEKMAS 2020. I also would like to convey my warm welcome to all FIRST 2020 and SNAPTEKMAS 2020 keynote speakers and all participant.

Thank to the God, although we are facing the corona pandemic, the researchers are still be able to produce good research and still have great spirit in finding new technique or methods in many areas. The purpose of the FIRST is basically to provide the researchers and academia to exchange, to discuss the results of their studiy so that it can meet the industrial needs and government regulations, and also to publish the research. Although, this year conference should be held virtually, however, it is hoped that the FIRST 2020 and SNAPTEKMAS 2020 are still able to facilitate researchers from all over the world to meet and to make opportunities to collaborate.

FIRST has been held for four times and organized by State Polytechnic of Sriwijaya. The previous beginning FIRST conference was a National Conference and it was held on October 27, 2015, with the theme: Peningkatan Kualitas SDM melalui Penelitian Teknologi Tepat Guna dalam Menghadapi Ekonomi Asean. On 2016, the FIRST was upgraded in order to enhance the quality of the conference. The first FIRST international conference was held in State Polytechnic of Sriwijaya, on October 18-19, 2016, while the second FIRST international conference was held on October 30-31, 2019 at Horison Ultima Hotel Palembang, and the 3<sup>rd</sup> FIRST was held on October 9-10, 2019, at Excelton Hotel Palembang, Indonesia.

This 4<sup>th</sup> FIRST 2020 International Conference has attrated 8 participants, i.e., from Malaysia, Brunei Darussalam, Japan, Taiwan, Thailand, United Kingdom, Hungaria, and Cambodia. While SNAPTEKMAS has become the destination of 6 biggest university in Indonesia.

This year FIRST 2020 and SNAPTEKMAS 2020 conference is held on November 11, 2020, at Beston Hotel. This conference will present:

1. Prof. Chiaki Ogino, from kobe University, an expert in biodiesel field
2. Dr. Wahyu Caesarendra, S.T., M. Eng., from Universiti Brunei Darussalam, an expert in mechanical engineering
3. Prof. Yuliansyah, M.S.A., Ph.D, Akt, CA, from Lampung University, an expert in Accounting
4. Dr. Dodi Reza Alex Noerdin, as Bupati Musi Banyuasin, expert in government policy for technology implementation
5. Assoc. Prof. Dr. Mohammed N Adurazaq, from Management and Science University (MSU), an expert in health technology, and
6. Dr. Muhammad Haikal Satria, IPM, from Jakarta Global University, an expert in health

Finally, I also want to say thank you very much for your participation, I hope that you can enjoy this FIRST 2020 and SNAPTEKMAS 2020.

Wassalamu'alaikum wr wb

## **FOREWORD FROM DIRECTOR OF STATE POLYTECHNIC OF SRIWIJAYA**

Assalamu'alaikum wr wb,

In the name of Allah, the most gracious, the most merciful. First of all, I would like to convey my warm welcome to all of FIRST 2020 and SNAPTEKMAS 2020 keynote speakers and all participant of FIRST 2020 and SNAPTEKMAS 2020. It is my great pleasure to meet and see you in this event.

As we know, the corona pandemic has hit many sectors in the world. Not only the economic one but also the social, and education. As incredibly crucial to the growth and sustainability of innovation and learning within the academic community, some events, such as: academic conferences, seminars, and even lectures themselves, have also been the worst hit by this corona pandemic. A lot of important events has been adversely affected due to region-wide lockdowns.

Therefore, to accommodate the researchers from all over the world and to be consistent in maintaining the continuity and the development of science and technology, the FIRST 2020 and SNAPTEKMAS 2020 are still held in this year although in virtual way. The FIRST 2020 and SNAPTEKMAS 2020 become one of State Polytechnic of Sriwijaya annual event. It is hope that FIRST 2020 and SNAPTEKMAS 2020 become one of the conferences that support the advance of the science and technology.

As our attention on COVID-19 tragedy, in this year, we also make a cooperation with the ITKJ (institut Teknologi Kesehatan Jakarta) or now JGU (Jakarta Global University) that focuses on the health and health technology. Therefore, in this occasion, We also invite special issues research about COVID-19 to participate in FIRST 2020 and SNAPTEKMAS 2020 conferences.

Finally, I also want to say thank you very much for your participation, I hope that you can enjoy this conference and can follow all of the agenda until the closing of this conference.

Wassalamu'alaikum wr wb

## KEYNOTE SPEAKER

### **Prof. Dr. Chiaki Ogino**

Chiaki OGINO is the Professor of Department of Chemical Science and Engineering, Graduate School of Engineering, Kobe University, Japan. He received his B.Sc., M.Sc., and Ph.D. in Chemical Engineering at Kobe University, Japan. He has supervised more than 50 over master course students, and 10 over doctor course students in Kobe University. He is the author or co-author of over 230 peer-reviewed journal papers and 40 reviews and book chapters. His research interests are wide and concern: production of biofuels and chemicals from biomass based on synthetic biotechnology by Yeast, Fungi and Actinomycetes, and development of novel drug and gene delivery systems based on nanobiotechnology.

## KEYNOTE SPEAKER

### **Wahyu Caesarendra, PhD**

Assistant Professor of General Engineering Faculty of Integrated Technologies, Universiti Brunei Darussalam, Jalan Tungku Link, Gadong BE1410, Brunei Darussalam. Research Interests: Machine Learning, Product Design, Mechatronics, and Smart Manufacturing Ph.D. Mechanical Engineering, University of Wollongong, Australia (2015) M.Eng. (Hons.). Mechanical Design Engineering, Pukyong National University, South Korea (2010) B.Eng. (Hons.) Mechanical Engineering, Diponegoro University, Indonesia (2005). EMPLOYMENT HISTORY: Assistant Professor Faculty of Integrated Technologies, Universiti Brunei Darussalam (08/10/2018 - date). Assistant Professor Department of Mechanical Engineering, Diponegoro University (Jul 2017 – Des 2019). Visiting Asst. Prof. National Taiwan University of Science and Technology (August 2019). Lecturer Department of Mechanical Engineering, Diponegoro University (Dec 2010 – Jun 2017). Postdoctoral Research Fellow School of Mechanical and Aerospace Engineering, Nanyang Technological University (02/02/2017 - 19/09/2018).

## **KEYNOTE SPEAKER**

### **Prof. Yuliansyah, M.S.A., Ph.D, Akt, CA**

Bachelor at Jenderal Soedirman University – Indonesia 1998, Magister Program M.S.A. Meinders School of Business, Oklahoma City, University, United State of America 2006, Doctoral Program Ph.D Division of Business, University of South Australia, Australia 2012. Founder and Chairman of The Udjung Syahrir Foundation and Founder and Chairman of Goodwood Publishing ([goodwoodpub.com](http://goodwoodpub.com)). Board Committee of Asia Pacific of Management Accounting Association, International Consultant for Qualitative Study (Nvivo Program), The Quality Assurance Team for the Forensic Auditor Professional Certification Institute, Member of Asian Academy of Management, British Accounting and Finance Association Member.

## KEYNOTE SPEAKER

### **Dr. H. Dodi Reza Alex Lic, Econ, MBA**

Doctor of Public Administration Program, Faculty of Social & Political Sciences, Padjadjaran University, Bandung, West Java. Fellowship on IDEAS 2.0, Massachusetts Institute of Technology (MIT) Sloan School of Management, Cambridge MA, USA. Master of Business Administration (MBA), Solvay Business School, Université Libre de Bruxelles, Brussels, Belgium. Graduated with the title of Magna Cum Laude. Licencié en Sciences Economiques (Bachelor of Economics), University of Leuven (UCL), Louvain-la-Neuve, Belgium. Graduated with the title 'Grande Distinction (High Honor). Top 2%, A thesis written in French, received the BBL Prize Award. Primary and Secondary Education in Indonesia and Canada. 2017-2022 as Regent of Musi Banyuasin Period, 2014-2016 as Deputy Chairperson of Commission VI DPR RI and Deputy Chairperson of the Golkar Party Faction DPR RI. 2013-2015 as PT. Liga Indonesia Commissioner, Jakarta, Indonesia. In 2009-2014 as Member of the DPR / MPR-RI for the period of 2009-2014.

## KEYNOTE SPEAKER

### **Dr. Muhammad Haikal Satria, IPM**

Expertise : Software Engineering, Medical Informatics, Communication Protocol in Healthcare, Software as Medical Devices, QoS Provision in Data Communication. Universiti Teknologi Malaysia Johor, Malaysia Phd (on Electronics engineering) 2007 – 2014. Dissertation : Integration of Multimetric Path Management Into 802.11s For Telemedicine Quality Of Service Provision Universitaet Duisburg Essen Duisburg, Germany MSc (Master of Science) 2006. Thesis : Implementation of a secure RMI connection in a web service monitoring application. University of Indonesia Depok, Indonesia MT (Master of Engineering) 2006 University of Indonesia Depok, Indonesia ST (Bachelor in Engineering) 2003, Thesis : Downlink connectivity on MC-DS-CDMA in Rayleigh dan Rician fading channel.

## KEYNOTE SPEAKER

**Assoc. Prof. Dr. Mohammed N. Abdulrazaq Alshekhlly**

Field of specialisation : Semi-solid Metal Processing, Advanced Materials Joining, Internet of things (IoT), Robotics. Fields of interest : Metal Processing , Metallurgy Friction welding, Metal Matrix Composites, Materials Failure Analysis, Surface engineering/ Wear of materials, Biomedical sciences. Doctor of Philosophy (Ph.D) In Mechanical and Materials Engineering. Department of Mechanical and Materials Engineering, National University Of Malaysia (UKM) (2011–2015). Master In Mechanical Engineering, Department of Mechanical and Materials Engineering, National University Of Malaysia (UKM) (2009 – 2010). B.Sc. In Mechanical/Production Engineering. Department of production & Metallurgy Engineering, University of Technology-Baghdad (2002 – 2006).

## ABSTRACT

Electroplating is a method of using electrolyte solutions to cover solid materials with metal layers. The strong metal waste from the electroplating process is contained in B3 waste (Hazardous Toxic Materials). One of the methods for electroplating is by combining filtration and electrocoagulation methods. The parameters observed in this study were total dissolved solid (TDS), pH, conductivity, and Cr and Ni electroplating wastewater content before and after treatment. This research was conducted by adjusting the processing time and the distance between the electrode plates. The cycle time is 30, 60, 90, 120 and 150 minutes with an electrode spacing of 1, 2 and 3 cm. This feedback is to the activated carbon filter and the silica sand by the electrocoagulation process using aluminum electrodes. The feedback is filtered with a cartridge filter and a reverse osmosis (RO) filter. The results show that the optimum TDS, pH, conductivity and levels of Cr and Ni occur at a processing time of 150 minutes at an electrode distance of 1 cm. The pH value rose from 5.63 to 7.89, and the TDS decreased from 234 ppm to 73.6 ppm. Conductivity also decreased from 1466  $\mu\text{s}/\text{cm}$  to 148.5  $\mu\text{s}/\text{cm}$ . Cr and Ni have decreased from 8.43 ppm to 0.29 ppm and from 9.288 ppm to 0.893 ppm. The outcomes of this waste treatment met the requirements for clean water (Regulation of the Minister of Health of the Republic of Indonesia, No 32 of 2017) and industrial wastewater (Regulation of the Minister of the Environment of the Republic of Indonesia, No 5 of 2014).

## 1. INTRODUCTION

Metals such as iron, brass and aluminium are commonly used as industrial and domestic products. In order to improve surface quality, particularly in terms of beauty and corrosion resistance, this industrial material must be coated with stainless metals such as silver, nickel and chromium. Electroplating or gilding is a method of coating a solid material with a metal layer by letting the electrical current flows through an electrolyte solution. The strong metal waste from the electroplating process is contained in B3 waste (Hazardous Toxic Materials) [1-2].

Some of the metal elements in electroplating wastewater include iron, chromium, zinc, nickel, manganese and copper. The amount of waste produced in the electroplating process is not too high, but the level of toxicity, particularly chromium, nickel and zinc, is hazardous. The characteristics and toxicity of wastewater electroplating differ according to operational

conditions, the method of coating, and procedure of washing [3-6].

The direct disposal of waste from the electroplating process to the environment without prior treatment can cause environmental pollution. These contaminants can contaminate microorganisms and their environment in the form of solutions, colloids and other types of particle. Given the significance and magnitude of the environmental effects, treatment is required before waste effluent is discharged into the environment [7-9].

Some methods used to treat electroplating waste include precipitation, microorganisms, ultrafiltration, reverse osmosis, and others. Precipitation is the most economical process, but precipitation is also capable of creating added chemical waste. Other methods also have disadvantages, such as the high cost necessary and difficult to achieve on an industrial scale [10-14].

The electrocoagulation approach is another alternative that can be used for electroplating waste treatment. Electrocoagulation is a process that is effective and simple to operate to minimize heavy metal

content by electrolysis reactions and does not involve the addition of chemical coagulants[15-18].

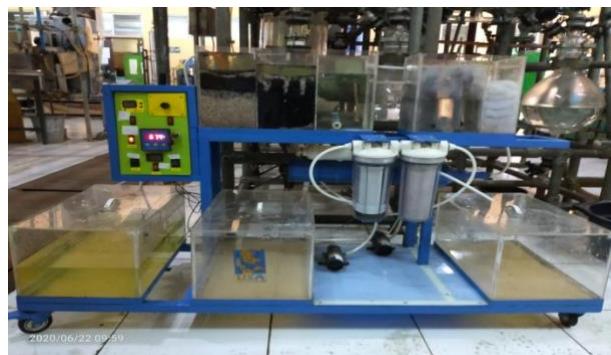

In 1995, Matteson introduced an electronic coagulator in which the electrical current applied to the anode would dissolve aluminium into a solution that would then react with hydroxy ions (from the cathode) to form hydroxy aluminium. Hydroxy flocculates and coagulates suspended particles resulting in a method of separation of solids from wastewater [19, 20].

This is illustrated by a number of previous studies. One example is the research conducted by Ratnawati [20], who treated electrocoagulation waste using Fe electrodes. Electroplating waste treatment using electrocoagulation is known to be capable of reducing Cu, Ni and Cr concentrations at the lowest concentrations.

The electroplating wastewater treatment with electrocoagulation methods in this study is conducted using different electrodes from previous studies. In earlier studies, the electrodes used are aluminium electrodes. The parameters observed in this study were TDS, pH, conductivity, and Cr and Ni electroplating wastewater content before and after treatment. This research was performed by adjusting the processing time and distance of the electrode.

## 2. RESEARCH METHODE

This research was conducted to determine the characteristics of electroplating waste prior to and after treatment with a combination of filtration and electrocoagulation processes. The electroplating waste to be used is extracted from the Cr and Ni coating in the Kertapati region in Palembang, South Sumatra. The parameters observed were TDS, pH, conductivity, and Cr and Ni contents.

**Figure 1** Combination of Filtration and Electrocoagulation Process for electroplating wastewater

The materials used in this study were aluminium plate electroplating waste as an electrode with dimensions of 22x12.5 cm, Cr and Ni standard solutions and H<sub>2</sub>SO<sub>4</sub>.

The instruments used in this study included a range of electrocoagulators, Waterproof cyberscan PCD 650, GBC AAS 932 Plus and ICP-OES.

The data collection stage was focused on variations in processing time and electrode distance. Sample treatment varied with processing times of 30, 60, 90, 120 and 150 minutes and with electrode distances of 1, 2 and 3 cm. The electroplating waste management method with a filtration and electrocoagulation device is shown in Figure 1.

## 3. RESULTS AND DISCUSSION

### 3.1. Results of Characterization of Electroplating Waste before the Filtration and Electrocoagulation Process

Electroplating wastewater is first characterized before filtration and electrocoagulation treatment to establish the initial conditions of electrification waste before treatment. The results of the characterization of electroplating waste are shown in Table 1.

Table 1. Results of initial characterization of electroplating waste

No.	Parameter	Results	Standard*
1	TDS (ppm)	234	1000
2	pH	5.63	6-9
3	Conductivity ( $\mu\text{s}/\text{cm}$ )	1466	20-1500
4	Cr (ppm)	8.43	0.5
5	Ni (ppm)	9.288	0.1

### 3.2. Effect of Electrode Distance and Processing Time on TDS

TDS (Total Dissolved Solids) is the quantity of substance dissolved in water. This substance can be in the form of carbonate, bicarbonate, chloride, sulfate, nitrate, calcium, magnesium, sodium, organic ions, colloidal compounds and others. TDS can be used to measure the consistency of drinking water since it represents the number of ions in the water. The value of the water quality criteria for the TDS test parameters approved under the national standard is 1000 ppm (Health Minister of the Republic of Indonesia, 2017).

Figure 2 indicates that the TDS value in the waste sample decreased by 234 ppm from the initial TDS after passing through the electrocoagulator. After processing, the TDS value decreased to 73.6 ppm. This condition occurs at a processing time of 150 minutes and an electrode distance of 1 cm. The effects of this decrease show that the longer the processing time and the closer the electrode size, the lower the TDS value. The waste is treated with aluminium electrodes with a distance range of 1, 2 and 3 cm. The variation of the electrode distance is matched to the width of the electrocoagulation bath. The electrode distance of 1 cm

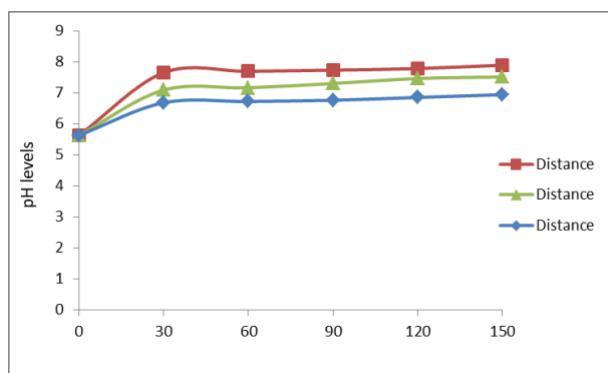

produces more coagulants than the electrode distances of 2 and 3 cm. Process time and electrode distance can affect the rate of formation of the coagulant, regulate the speed and size of the bubbles and the growth of the floc, which may bind the pollutants to the waste so that more floc is created. The bubbles produced during the electrocoagulation phase bring up the contaminants in the waste so that the current contaminants can be easily collected together. The  $\text{Al}^{3+}$  ion produced at the anode reacts with the  $\text{OH}^-$  ion generated at the cathode to form  $\text{Al(OH)}_3$  which binds existing pollutants so that they can be precipitated more easily.

**Figure 2** Effect of electrode distance and processing time on TDS

### 3.3. Effect of Electrode Distance and Processing Time on pH

The pH is the concentration of hydrogen ions ( $\text{H}^+$ ) in water. The pH value is significant as a water quality parameter because it can monitor the form and rate of multiple reactions in the water. The increase in pH value in the electrocoagulation process is due to the addition of alkaline  $\text{Al}^{3+}$  ions to the water. As accumulation occurs, the hydrolysis of the water induces a reaction to the hydroxyl ion. This reaction produces 3 ions of  $\text{Al(OH)}$  and hydrogen.

**Figure 3** Effect of electrode distance and processing time on pH

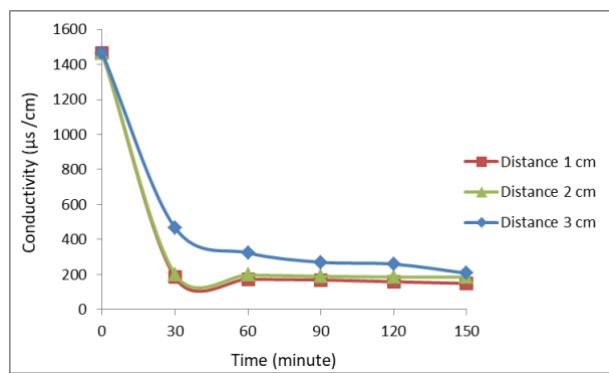

Electroplating waste was electrocoagulated with aluminium electrodes with distance variations of 1, 2,

and 3 cm. Based on Figure 3, the pH value of the electroplating waste sample from the initial pH of 5.63 (acid) is increased. The closer the electrode gap results in the increment of pH value. Following sampling, the pH value has increased to 7.89 (neutral) with a processing time of 150 minutes and an electrode distance of 1 cm. Water electrolysis produces hydrogen gas ions and hydroxide ions in the electrocoagulation process. The radius of 1 cm from the electrode accelerates ion exchange by 2 to 3 cm from the electrode.

Moreover, the longer the treatment time, the quicker hydrogen gas and hydroxide ions can form. The hydroxide ion reaction produces a coefficient more significant than the hydrogen coefficient. This result shows that hydroxide ion formation happens when the size of the electrode is closer, and the treatment time is longer. This condition raises acidity to close or neutral pH.

### 3.4. Effect of Electrode Distance and Processing Time on Conductivity

Conductivity is a measure of the ability of a substance to conduct electrical current. Water conductivity is directly related to the concentration of dissolved solids ionized in water. Conductivity is also known as specific conductivity. Conduct (G) is the inverse of resistance (R). Each material has specific properties, which are defined as resistivity ( $\rho$ ) in ohmmeters (P).

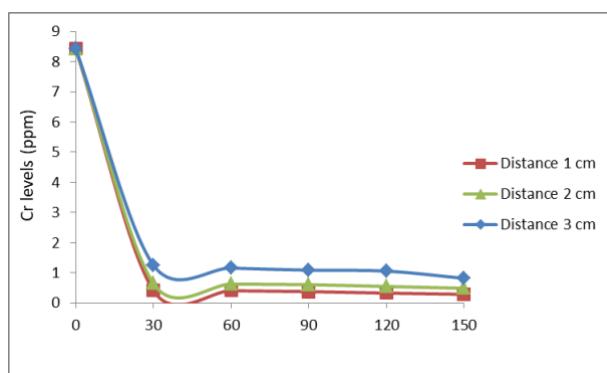

**Figure 4** Effect of electrode distance and processing time on conductivity

Electroplating waste treatment is carried out by an electrocoagulation device that uses electricity in the process. The electrodes used are aluminium with distance variations of 1, 2, and 3 cm, which affect the conductivity value of the treated waste. Figure 4 shows that the conductivity value in the waste sample decreased from an initial conductivity of  $1466 \mu\text{s}/\text{cm}$  to  $148.5 \mu\text{s}/\text{cm}$  after passing through the electrocoagulator. This condition occurs at a processing time of 150 minutes and at an electrode distance of 1 cm. The effects of this decrease show that the longer the processing time and the closer the electrode gap, the

lower the conductivity value. The electrode distance of 1 cm accelerates the ion exchange compared to the electrode distances of 2 and 3 cm, making the coagulant faster. Process time and electrode distance can affect the rate of formation of the coagulant, regulate the speed and size of the bubbles and the growth of the floc, which may bind the pollutants to the waste so that more floc is created. The number of ions influences the conductivity value in the solution. The greater the number of dissolved solids, the greater the number of ions in the solution, since the amount of dissolved solids includes ions which are arranged into dissolved solid compounds. This result indicates that the importance of TDS and conductivity would have a close relationship.

### 3.5. Effect of Electrode Distance and Processing Time on Cr

Chromium (Cr) is a metal with a high degree of toxicity. Cr metal in the electroplating industry is used in the hard-coat process to be anti-dull. The toxic effect of Cr from electroplating waste can be bioaccumulative and can not be decomposed. The Cr content data obtained by Atomic Adsorption Spectrophotometer measurement were analyzed to determine the relationship between Cr metal absorption and processing time and electrode distance. The electrodes used are aluminium with a distance variation of 1, 2 and 3 cm.

**Figure 5** Effect of electrode distance and processing time on Cr

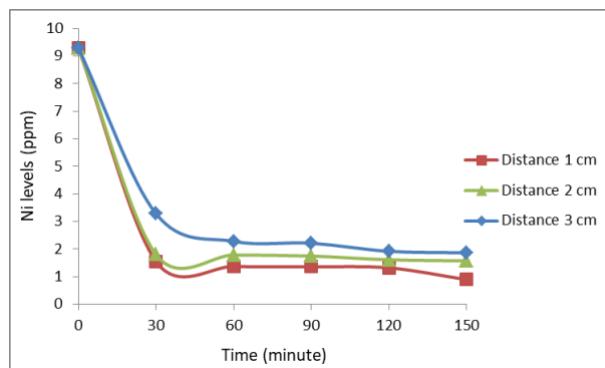

Figure 5 demonstrates the effects of electroplating waste treatment by electrocoagulation technology. The initial Cr content for electroplating waste was 8.43 ppm. The Cr content decreased along with the longer the processing time and the closer the electrode distance so that the optimum Cr content was 0.29 ppm at 150 minutes of processing time and 1 cm of electrode distance. This condition occurs due to more coagulants generated by the long processing time and the close electrode gap. The higher the coagulant mass, the simpler the  $\text{Cr(OH)}_3$  precipitates to form and the lower the Cr metal content. Electrode distance of 1 cm

accelerates ion-exchange compared to electrode distances of 2 and 3 cm. Cr metal in waste interacts with  $\text{OH}^-$  ion, which allows Cr to precipitate in waste to form  $\text{Cr(OH)}_3$ . The  $\text{Cr(OH)}_3$  deposit can act as a floc centre that is electropositive and absorbs excess  $\text{OH}^-$  in the solution so that it forms a floc and can draw other metal cations to the waste..

### 3.6. Effect of Electrode Distance and Processing Time on Ni Metal Content

Nickel is used in the electroplating industry for decorative coatings of Cr metal coating steel parts. Ni metal is also metal with a hazardous toxicity level. Ni material data collected through Atomic Adsorption Spectrophotometer measurements were analyzed to determine the relationship between Ni metal absorption and processing time and electrode distance.

Electroplating wastewater is treated using aluminium electrodes, which vary in distance gap from 1, 2 and 3 cm apart during electrocoagulation process. Figure 6 shows that Ni levels decreased from an initial Ni level of 9.288 ppm after being treated with electrocoagulation technology. Ni levels decreased together with the more extended the processing time and the closer the electrode distance so that the optimum Ni content was 0.893 ppm at 150 minutes of processing time and 1 cm of electrode distance. This result is due to more coagulants will be generated by the long processing time and the closer electrode gap. The electrode distance of 1 cm accelerates the ion exchange compared to the electrode distances of 2 and 3 cm so that more coagulants are produced. The more coagulant mass ratio allows the formation of  $\text{Al(OH)}_3$  deposits. The more coagulant the mass and the higher the pH value, the more  $\text{OH}$  ions react with Ni Metal to form  $\text{Ni(OH)}_2$  precipitates in the waste.

**Figure 6** Effect of electrode distance and processing time on Ni metal content

The objective of electroplating waste treatment using electrocoagulation in this study is to compare the reduction of pollutants in electroplating waste before and after treatment. The results of this study show that it is suitable for public consumption based on clean water standards (Regulation of the Ministry of Health of the

Republic of Indonesia No. 32 of 2017) and industrial wastewater standards (Regulation of the Ministry of Health of the Republic of Indonesia No. 32 of 2017).

Aluminium electrodes are used in this processing since it is inexpensive and easy to find. The results show that the Al-Al electrode is the optimal electrode. This mixture is used for further optimisation. The most floc formed in the combination of Al-Al electrodes is the aluminium electrodes quickly form  $\text{Al(OH)}_3$  hydroxide and complex hydroxyl polymers. The more flocks that are created, the more contaminants are consumed to make the reduction of pollutants in electroplating liquid waste more optimal. The reaction in the electrode cell to the anode and cathode used in aluminium is as follows:

Reaction on the anode:

The anodic process leads to the aluminium metal being dissolved into  $\text{Al}^{3+}$  ion molecules. The formed ions are hydrolysed and produce solid  $\text{Al(OH)}_3 \cdot x\text{H}_2\text{O}$  that can not be dissolved in water. The Response:

The reaction is produced in a solution that can serve as a coagulant for the coagulation-flocculation phase that occurs in the next electrocoagulation cell process.

The reaction at the cathode:

Based on the results of the study, it is established that the optimum TDS, pH, conductivity and levels of Cr and Ni are observed at 150 minutes of processing time and 1 cm of electrode distance. This result proves that the longer the processing time and the closer the distance between the electrodes would result in more coagulants. The increase increment of coagulants has increased the pH value, while the TDS value and conductivity, as well as the Cr and Ni levels, have decreased.

## 4. CONCLUSION

The results of electroplating waste characterization after treatment by filtration and electrocoagulation showed changes. The pH value rose from 5.63 to 7.89, and the TDS decreased from 234 ppm to 73.6 ppm. Conductivity also decreased from 1466  $\mu\text{s}/\text{cm}$  to 148.5  $\mu\text{s}/\text{cm}$ . Cr and Ni have decreased from 8.43 ppm to 0.29 ppm and from 9.288 ppm to 0.893 ppm.

Process time and electrode distance in the electrocoagulation method affect the consistency of the electroplating waste properties. The longer the processing time and the closer the distance between the electrodes would result in more coagulants. The coagulants increment has increased the pH value, while the TDS value and conductivity, as well as the Cr and Ni levels, have decreased.

Based on the results of the analysis, the optimum levels of TDS, pH, conductivity, and Cr and Ni were detected at 150 minutes of processing time and 1 cm of electrode distance.

## AUTHORS' CONTRIBUTIONS

All of the authors are involved in the process of designing the equipment and analysis electroplating wastewater. The first and corresponding author contribution is responsible for data processing and manuscript writing. The second author is responsible for equipment design and data processing. The third author is responsible for analysis sample electroplating wastewater. The fourth author is responsible for funding arrangement.
