WELCOMING SPEECH AND OPENING RECTOR OF DIPONEGORO UNIVERSITY

Honorable Keynote Speakers, Prof. Dr. Lee Lam Hong from Quest International University Malaysia; Prof. Henk Heijnis from Australia Nuclear for Science and Technology (ANSTO); Prof. Alfonso J. Rodriquez-Morales from Institucion Universitaria vision de las Americas, Colombia; Dr. Remco van Merm from IUCN, Switzerland; Dr. MV Venkatasamy Reddy from Institute of Research Hydro-Quebec, Montreal, Canada; Dr. A.T.P.G. van Engelenhoven from University Lecturer Southeast Asian Linguistics, Faculty of Humanities, Leiden Institute for Area Studies SAS Indonesia ; Prof. Dr. Tri Retnaningsih Soeprbowati, M.App.Sc from School of Postgraduate Studies, Undip, Indonesia; All conference guests and participants

Ladies, and Gentlemen,

It is my great honor to welcome you to the 7th International Conference on Energy, Environment, Epidemiology and Information System (7th ICENIS 2022). This is the seventh international conference organized by the School of Postgraduate Studies Diponegoro University following the success of 1st ICENIS 2016, 2nd ICENIS 2017, 3rd ICENIS 2018, 4th ICENIS 2019, 5th ICENIS 2020, and 6th ICENIS 2021. With its remarkable accomplishment, this event is expected to be performed annually. We are very much support this prestigious conference which is attended by more than 200 participants.

Diponegoro University (UNDIP) is a prominent university located in Semarang, the capital of Central Java. Undip has a strong tradition to carry out Education and Research as well as community services. The university has eleven Faculties and two schools which are School of Postgraduate Studies and School of Vocational Studies. We are also organizing 49 Undergraduate Programs, 35 Master Programs, and 14 Doctoral Programs.

UNDIP is one of the most well-known state universities in Indonesia with an international reputation for its teaching and research activities. In July 2021 Undip ranked 8th in Indonesia according to QS World University Ranking and ranked 9th in Indonesia in the QS Asian University Ranking. Undip scientific publications indexed in Scopus totalled 7790 documents and ranking 7th in Indonesia, Undip Scientific Publications indexed in Scopus (31 Januari 2020).

Ladies and Gentlemen,

The topic of the conference this year is Reconciliation of Energy, Environment, Health, and Digital Information after The Covid-19 Pandemic for Global Prosperity. This topic is very important since human security has been considered as the basic need for a country. The security in food, energy, water as well as health are the foundation of the country. The country must ensure that these needs are covered and secured for country populations and through Sustainable Developments Goals (SDGs) stated by United Nations, these human securities must be covered by each countries in the world.

7th ICENIS 2022
International Conference on Energy, Environment,
Epidemiology, and Information System
August, 9th - 10th 2022
Semarang - Indonesia
icenis2022@live.undip.ac.id

Currently we are facing global challenges, not only the depletion of natural and energy resources, environmental degradation, but also pandemic COVID-19 which is currently major health problems which needs to be tackled by every country in the world. It is our responsibility to develop better. I hope this conference will be an excellent platform to strengthen our concern and effort in confirming sustainable development for future human security.

Through this conference, I hope experts and researchers from all over the world could meet and share their experiences and knowledge to have explicit understanding regarding the complexity of the problems. I also hope this conference will present a memorable learning experience to all contributors and participants. It is expected that papers presented in this conference are documented for our future reference and encourage further research in relevant areas.

Thank you

Prof. Dr. Yos Johan Utama, SH, M.Hum

WELCOMING SPEECH DEAN OF SCHOOL OF POSTGRADUATE STUDIES DIPONEGORO UNIVERSITY

Distinguished Guests, Ladies, and Gentlemen,

It is my pleasure to welcome everyone to the 7th International Conference on Energy, Environment, Epidemiology and Information System (7th ICENIS 2022) organized by the School of Postgraduate Studies Diponegoro University.

This international conference is a part of conference, seminars, and workshop activities provided by the School of Postgraduate Studies Diponegoro University. ICENIS 2022 brings out the ideas and researches in the fields of energy, environment, epidemiology and information system towards sustainable development. This conference promotes new approaches and innovations in the aforementioned fields. All is in support of creating sustainable energy and technology without depleting natural resources.

The objectives of the ICENIS 2022 are:

- creating an international forum for the researchers, students, industries, and governments to communicate their research results on the fundamentals and applications of energy, environment, epidemiology and information system,
- sharing and exchanging ideas, thoughts, and discussion on all aspects of energy, environment, epidemiology and information system,
- facilitating the formation of network among participants to enhance the quality and benefit of research and development.

Furthermore, this conference also constitutes a great opportunity for escalating collaboration among institutions in term of various academic necessities.

I would like to thank the Keynote Speakers for allowing us a chance to experience a valuable sharing. It is essential to gather experts in the field of science and technology to improve the quality of postgraduate education.

Dr. R.B. Sularto, SH., M.Hum
Dean of School of Postgraduate Studies

WELCOMING SPEECH CHAIRPERSON OF the 7th ICENIS 2022

Your excellency,
Rector Universitas Diponegoro (UNDIP),
All of the deans from UNDIP,
Keynote speakers, Moderators,
Head of the study program at SPS,
All participants, Ladies, and gentlemen,

On behalf of the ICENIS 2022 Organizing committee, I am honored and delighted to welcome you to the 7th International Conference on Energy, Environment, Epidemiology, and Information System (ICENIS) 2022, with the theme is “Reconciliation of energy, environment, health, and digital information after the Covid-19 pandemic for global prosperity”. This conference is expected to designate an interactive international forum to provide a platform for sharing and exchanging information on the latest research on energy, environment, epidemiology, and information system.

Our technical program is rich and varied with 7 keynote speakers that come from 5 continents: America (Columbia, Canada), Australia, Asia (Indonesia, Malaysia), and Europe (Switzerland). There are 223 technical papers split between 12 parallel oral sessions each day. The participants come from various countries and from all over Indonesia consisting of researchers, lecturers, practitioners, and post and undergraduate students belonging to various institutions. A large number of papers submitted to this conference indicate that the interest in the field of energy, environment, epidemiology, and information system gains a continuous rise in this country and worldwide.

We are also proud to present the plenary speakers who are qualified to share their valuable information and knowledge at this conference. On behalf of the ICENIS 2022 Committee, we wish all participants to have good attainment. We would like to acknowledge our high appreciation to the Rector of Diponegoro University, the Dean School of Postgraduate Studies Diponegoro University, and the keynote speakers. I would also like to take this opportunity to thank the organizing team from the School of Postgraduate Studies, Diponegoro University for all their hard work and dedication in preparing for this conference. As we have tried our best in conducting this event, we humbly realize that we may still be lacking in some parts. Accordingly, we would like to apologize for any inconvenience. I sincerely hope you will enjoy today and the next days of the conference and networking. With great pride, we present ICENIS 2022, and we wish you an inspiring time. Thank you for your participation.

Dr. Budi Warsito, S.Si., M.Si.

Paper Title :

Industry 5.0: The Enabler of Sustainable Era

Abstract :

The Industrial Revolutions have successfully transformed the world economy by increasing the productivity and efficiency of various industries, using the edge cutting technologies and innovations of different eras. While the concept of Industrial Revolution 4.0 (IR4.0) has been introduced since more than a decade ago, the implementation of its technologies has not been seen popular in various sectors. This is due to the fact that there are numerous challenges stand in the way of universal implementation of IR4.0 at present. To name a few, the reliability of machine to machine communication, cyber-security concerns, the fear of mass layoffs which may cause social economy and security issues, limited resources and data for developing effective cognitive computing systems, are the main obstacles which restrict the development of IR4.0. While the focus of IR 4.0 is on improving productivity via inter-connectivity of cyber-physical systems and cognitive computing, IR5.0 utilises of the groundwork and platform laid by IR4.0, and introduces the return of human hands and minds into the framework. This talk aims to explore the ways that IR5.0 puts together the creativity of human, the precision of robotic, and the high computation power of modern computers and electronics to achieve optimal solutions and efficient systems for the industry, which will be the key of success in the next few decades. IR4.0 and IR5.0 have cooperatively created a blueprint that industries must oblige in order to achieve a sustainable and harmonious environment, in optimising the productivity of various industries, from farming to manufacturing, while minimizing the risk of mass layoffs of human labour, and the threat to environmental pollutions.

*Lessons from the past: Using Geological Archives for
Sustainable Environmental Planning and the Impact of
Rapid Climate Change on Fragile Ecosystem*

Abstract :

The protection of fragile ecosystems all over the world is of utmost important to save certain species from extinction and ensure diversity. The rate of climate change is unprecedented in its speed and impact on our society and ecosystems. However, without a sound understanding of past conditions and natural change within ecosystems it is difficult to determine the outcomes of sustainable environmental planning. The presentation will discuss environmental change in two critical ecosystems, using techniques to reconstruct environmental histories over decades to hundreds of years. The first example is coastal Antarctica, where ecosystems were under threat from Ozone depletion during the latter half of the 20th century. The second example deals with one of the Galapagos Islands, where ecosystem can cope with a highly variable, El Nino and La Nina driven climate, but human impact can destroy the fragile native vegetation on some of the islands.

*Archiving Traditional Knowledge after the COVID
Pandemic in Nusantara the case of Makuva, a moribund
language of Timor-Leste*

Abstract :

Insular Southeast Asia – alternatively referred to as Nusantara – contains five nations: the Philippines, Malaysia, Singapore, Indonesia and Timor-Leste. Although different in size and history, all five countries are characterised by a complex ethnic-cultural diversity, which may be challenged by well-meant suggestions improvement. Loss of traditional knowledge is salient problem in all Nusantara nations. This contribution discusses the pitfalls of traditional knowledge archiving by taking Makuva, a minority language on the edge of oblivion in Timor-Leste, as a case study. It will be shown that the researcher, the nation and the language community have their own interests, which all need to be considered in archiving

Paper Title :

*Impacts of COVID-19 on Biodiversity Conservation: What
Lessons Can We Learn as We Build Back Better?*

Abstract :

When Covid-19 caused strict lockdowns and travel bans around the world, the collapse of the tourism industry had a direct impact on the availability of funding for biodiversity conservation all over the world. According to the UN World Tourism Organization, 7% of the world's tourism relates to wildlife, and in some parts of Africa, this figure is as high as 80%. As tourists stayed away, many local communities in rural Africa lost their livelihoods overnight. As a result, people living in proximity to wildlife found themselves forced to resort to poaching to continue to make a living. In addition, poaching had become easier due to the absence of tourists and rangers in the field. At the same time, National Parks and Game Reserves, and the authorities and non-governmental organizations managing them, also felt the loss of revenue from tourism. Add to that the fact that in many countries, public funding was redirected away from conservation, towards measures to control the pandemic. In April 2020, IUCN Save Our Species, with generous funding from the European Commission, was one of the first organizations to provide emergency funding to conservation NGOs in sub-Saharan Africa in response to the challenges caused by Covid. Financial support was provided to enhance anti-poaching operations, both through the use of technologies such as drones and surveillance cameras, and by putting more boots on the ground – providing new jobs for local communities. At the same time, projects benefiting from an IUCN Save Our Species grant supported the development of alternative livelihoods and alternative sources of protein, to reduce the need for people to hunt for, and consume, bushmeat. These projects offer examples of how local development and biodiversity conservation can go hand-in-hand.

As governments around the world are talking about “building back better”, biodiversity conservation should be mainstreamed into the economic post-Covid-19 recovery. When it comes to preventing the next zoonotic outbreak, nature conservation has a crucial role to play. As humans continue to encroach further on natural habitats, we come into contact with wildlife and pathogens that have so far existed in isolated areas. Covid-19 is not the first epidemic transmitted to humans through different host animals, nor will it be the last. It is not a matter of if, but when the next outbreak occurs.

icenis2022@live.undip.ac.id

Leaving natural areas undisturbed is the best protection against future such outbreaks. The development of conservation-based livelihoods in addition to tourism, can help reduce the need to encroach on intact natural habitats. Recognizing that human health is directly linked to the health of animals and ecosystems, the One-Health approach, i.e. cross-sectoral collaboration to address issues of health, food, water, energy, and environment, should be widely adopted as a means towards preventing future outbreaks of zoonotic diseases.

*Recent Advance Materials for Energy & Environment and
Sustainability*

Abstract :

In recent years advanced materials had a considerable interest in worldwide researchers due its interesting functional properties and applications in areas of energy storage and conversion, water, and health care technology

In my talk, I will discuss global issues related to Energy and Environment, also various studies high power and Energy density materials for related to electrical energy storage and conversion applications. Materials mining, fabrication, characterization techniques, fundamentals, interface studies and applications. I will focus on materials challenges for electric vehicles and smart grid and renewable technology applications. Battery fabrication and various fast charging, thermal management, importance of thermal runaway studies for electric vehicles and in situ and ex situ studies, reaction mechanisms, and present challenges in electric vehicles will be discussed. Finally importance of nanomaterials for health care and also i will discuss briefly materials mining and sustainability

Paper Title :

*Toward Water Security and Climate Resilience in
Indonesia*

Abstract :

Climate change impacts water conditions in Indonesia and had decreased rainfall which in turn affects a reduction in raw water sources to meet water needs for drinking and agriculture. Java, Bali, and Nusa Tenggara face water scarcity until 2030. Water resources management should therefore be an early focus for adaptation to climate change. Water security has been developed as a major theoretical framework in environmental governance and resource management. Some actions to achieve water security are able developed, such as protecting vulnerable water systems, mitigating the impacts of water-related hazards such as floods and droughts, safeguarding access to water functions and services, and managing water resources in an integrated and equitable manner. Sustainable lake management is an example of a success story of Indonesia adopting by UNEP Resolution. The establishment of national priority lakes, developing an integrated lake management plan, implementation of integrated programs, the establishment of the Presidential Decree on Save Priority Lakes, and enhancing global concern and action on lake conservation and rehabilitation. Paleolimnology is the study of inland water that used the physical, chemical, and biological information preserved in the sediment to reconstruct past environmental change (including climate change) as a base to develop sustainable lake management. Paleolimnology of small lakes in Dieng Central Java has proven the historical record of natural disasters and human activities had induced deterioration of the lake functions.

Keywords: water security, climate change, sustainable lake management

Master Data Management using Record Linkage Toolkit for Integrating Lecturer Master Data

M. Miftakul Amin^{1*}, *Adi Sutrisman*¹, and *Yevi Dwitayanti*²

¹Department of Computer Engineering, Politeknik Negeri Sriwijaya, Palembang 30139, Indonesia

²Department of Accounting, Politeknik Negeri Sriwijaya, Palembang 30139, Indonesia

Abstract. Merging databases from different data sources is one of the important tasks in the data integration process. This study will integrate lecturer data from data sources in the application of academic information systems and research information systems at the Sriwijaya State Polytechnic. This integration of lecturer data will later be used as a single data as master data that can be used by other applications. Lecturer data in the academic section contains 444 records, while those from the p3m section contain 443 records. An important task in the database merging process is to eliminate duplicate records. One of the important libraries in the formation of this master data management uses the record linkage toolkit which is implemented in the python programming language. The steps taken are pre-processing, generating candidate record pairs, compare pairs, score pairs, and finally the data link to merge the two data sources. In this study, 5 fields, namely username, name, place of birth, date of birth, and gender, from each data source were used to measure the level of record similarity. The result of this research is the formation of lecturer master data from the merging of the two sources.

1 Introduction

In the context of master data management (MDM), one or more records in a relational database concept can refer to an entity. The formation of master data management involves several tasks, including entity resolution, entity matching, and relation extraction [1]. The data that is processed in the formation of the master data management can come from the same data source or be heterogeneous [2]. Heterogeneous data is also related to the concept of data interoperability, where data can come from various sources [3] and involves web services technology or web application programming interface (API) [4]. One of the main tasks in establishing a master data management is to eliminate duplication of data in the source database [5].

Record linkage can be understood as a process for extracting records from various data sources and combining them to form a single entity [6], for both structured and unstructured data [7]. The same thing was also conveyed by [8] which defines that record linkage is a step to identify a number of records that refer to the same thing. In many cases, these records refer

* Corresponding author: miftakul_a@polsri.ac.id

to the information of a person or individuals attached to the same person [9, 10]. According to [11] record linkage is used to improve data quality and integration at the data mining and data warehouse stages [12] and decision-making processes [13]. Even according to [14] The record linkage stage is part of the cleaning stage in data mining. Record linkage itself is usually implemented into datasets that do not have a unique identifier [15]. The term record linkage [16] according to [17] has several equivalents, namely de-duplication and entity resolution. Other terms were also conveyed by [18] as data matching, probabilistic matching, and instance identification.

Various models of completion of record linkage have been studied, including [19], [20], [21], [22] and [23] using the Bayesian approach as an unsupervised approach. This study aims to detect duplication in the database under investigation. The most common approach in implementing record linkage is to use string similarity [24]. According to [25] that the string similarity level (s), $s = \text{sim}(a_i, a_j)$ is a similarity function that calculates the level of similarity between two attribute values a_i and a_j , which is in the range of values $0 \leq s \leq 1$. Several possible results of string similarity measurements can be categorized as follows:

- $\text{sim}(a_i, a_i) = 1$, is the result of a string similarity comparison where the two strings are exactly the same value.
- $\text{sim}(a_i, a_j) = 0$, is a result of calculating string similarity where the two strings are values that are different from one another.
- $0 < \text{sim}(a_i, a_j) < 1$, is the result of calculations between values that are exactly the same and different from one another. The greater the value, the more precise the degree of similarity will be.

In this study, a process for merging two datasets will be carried out containing information on lecturer data. The two datasets come from academic information systems and research information systems. The number of records in academic data is 444 records, while in Center for research and community service (P3M) data there are 443 records. The two databases will then be used as a single piece of data as master data which can later be used by other applications as lecturer master data.

2 Methods

Figure 1 shows the steps in merging databases using the record linkage approach. The steps taken include pre-processing, generating pairs, compare pairs, score pairs, and finally link data. All these stages are carried out using the record linkage toolkit library which is implemented in the python programming language.

Fig. 1. Record Linkage Steps

Some of these stages can be explained as follows:

- **Pre-processing:** At this stage, several standardizations of the dataset are carried out, such as changing the string to lowercase, eliminating more than one white space, uniforming

the format of the date of birth information.

- **Generate Pairs:** at this stage not all pairs of records in the two data sources will be processed. Only potential records will be processed. At this stage, the blocking and indexing processes are carried out, to obtain potential record pairs.
- **Compare Pairs:** At this stage, a process is carried out to compare the level of similarity between correlated fields using the string similarity function.
- **Score Pairs:** at this stage provide a score value that has calculated the level of similarity at the compare pairs stage. By giving a certain threshold value (Θ), the correct score is obtained to eliminate duplication of records.
- **Link Data:** the last stage is to perform the process of merging or joining two data sources, by first eliminating duplicate records.

3 Results and Discussion

3.1 Pre-Processing Step

The pre-processing stage is the most important stage. At this stage, uniform formatting and field selection are carried out for further processing. Not all fields in both data sources will be used. Only 5 pieces of field information will be used, namely username, name, place of birth, date of birth, and gender. At this stage, it is done to change the string in the name and place of birth fields to lowercase. In addition, if there is more than one white space, it will be deleted and made into one white space only. The following program code segments are used to perform pre-processing stages which are implemented on both dataset sources.

```
# pre-processing steps
def casefolding(text):
    text = text.lower()
    text = text.replace('\s+', ' ')
    text = text.strip()
    return text
```

3.2 Generate Pairs

At this stage of generating pairs, indexing and blocking processes will be carried out. This stage will reduce the number of candidate record pairs, because not all records will be compared. Only records that have a high degree of similarity will be used for further processing. Without using blocking, for example, the number of records is 500, a pair of 500 x 500 record pairs or 250,000 will be generated. Of course, this will make computing more complex. By using indexing and blocking, the number of records can be reduced. Using the `recordlinkage.Index()` function will produce indexing objects obtained from 2 datasets, in this case `dfA` which comes from academic data, and `dfB` which comes from research and community service data.

```
# Indexation step
indexer = rl.Index()
indexer.block(username)
candidate_links = indexer.index(dfA, dfB)
```

The important notation used to generate blocked pairs for a column is to call the `block()` function. After the `indexer` object is created, the `indexer.index()` method will be executed on

the two processed dataframes. Generate pairs will generate candidate_links containing multiindex information from both datasets.

3.3 Compare Pairs

At this stage a number of fields will be compared the level of similarity using the Jaro-Winkler similarity function. This method produces a range of values between 0 to 1. A value of 0 means that the two strings are not at all similar, while a value of 1 means that the two strings are the same value. The larger the resulting value, the more similar the two strings are. The following is a segment of program code to compare records.

```
# Comparison step
compare_cl = rl.Compare()
compare_cl.string(username, username, method=jarowinkler, label=username)
compare_cl.string(name, name, method=jarowinkler, label=name)
compare_cl.string(pob, pob, method=jarowinkler, label=pob)
compare_cl.string(dob, dob, method=jarowinkler, label=dob)
compare_cl.string(sex, sex, method=jarowinkler, label=sex)
features = compare_cl.compute(candidate_links, dfA, dfB)
```

3.4 Score Pairs

The score pairs stage is tasked with providing the value of comparing the results between the previous fields. By providing a threshold value (Θ) of more than ($>$) 3, a set of records will be obtained as a result of matching. The following is a code segment for the score pairs program.

```
# Classification step
matches = features[features.sum(axis=1) > 3]
```

3.5 Link Data

The data link is the final stage in a series of record linkage processes. This stage is tasked with merging or joining two datasets. The first step is to carry out the process to find duplicate records. After that, the duplicated data will be removed, and the results will be added in a new dataset as a result of the merger. The following is a segment of program code to perform the merging process.

```
# get duplicate values
duplicate_rows = matches.index.get_level_values(1)
# Finding duplicates in data2
data1_duplicates = dfB[dfB.index.isin(duplicate_rows)]
# Finding new rows in data2
data2_new = dfB[~dfB.index.isin(duplicate_rows)]
# link both dataframes
data=dfA.append(data2_new)
# save the result of merging data
data.to_csv('output/integrated_data.csv')
```

Figure 2 is the result of the merging of two datasets. A total of 444 records were merged, by eliminating the same records. Figure 2 provides information that after several stages of

deduplication are carried out, the results will be obtained in the form of 1 single dataset as a combination of two datasets. The formed dataset contains data that has no duplication.

Fig. 2. Merging Process Results

4 Conclusion

The establishment of master data management by processing lecturer data has been completed. With a classification technique using a threshold-based approach, a set of data is obtained that meets the merging criteria. From the two datasets, 444 records were obtained as the final result of the merging process. This record will later become the lecturer's master data which can be used by other applications as master data.

As future research, a real-time data merging process can be developed, so changes to each dataset can produce a single dataset that can be used directly. Another aspect that can be implemented is to test the performance of the results of duplication using several parameters to determine the quality of the model that has been developed.

We thank all those who have supported the publication of this article.

Master Data Management using Record Linkage Toolkit for Integrating Lecturer Master Data

M. Miftakul⁴, Adi¹, Yevi²

¹Universitas Islam Sumatera Utara, ²Universitas Islam Sumatera Utara, ³Universitas Islam Sumatera Utara, ⁴Universitas Islam Sumatera Utara

Abstract. This research aims to improve the accuracy of lecturer master data by using a Record Linkage Toolkit. The data is obtained from various sources and processed using the toolkit to identify and link records that refer to the same lecturer. The results show that the toolkit can successfully identify and link records that refer to the same lecturer, thereby improving the accuracy of the master data. The toolkit is a software tool that can be used to identify and link records that refer to the same entity. It is based on a probabilistic model that compares the attributes of two records and calculates the probability that they refer to the same entity. The toolkit can be used to identify and link records that refer to the same lecturer, thereby improving the accuracy of the master data.

1 Introduction

The master data management is a critical task for any organization. It involves maintaining a single, accurate, and up-to-date record of all the data that is used by the organization. In the case of lecturer master data, this involves maintaining a single, accurate, and up-to-date record of all the lecturers who are employed by the organization. This is a challenging task because there are often many different sources of data, and the data is often incomplete or inconsistent. This research aims to improve the accuracy of lecturer master data by using a Record Linkage Toolkit.

The Record Linkage Toolkit is a software tool that can be used to identify and link records that refer to the same entity. It is based on a probabilistic model that compares the attributes of two records and calculates the probability that they refer to the same entity. The toolkit can be used to identify and link records that refer to the same lecturer, thereby improving the accuracy of the master data.

similarity between two attribute values a_i and a_j , which is in the range of values $0 \leq s \leq 1$.

- $s = 0$ if a_i and a_j are completely different.
- $s = 1$ if a_i and a_j are identical.
- s is the ratio of the number of common characters to the total number of characters in the longer string.

similarity between two attribute values a_i and a_j , which is in the range of values $0 \leq s \leq 1$.

- $s = 0$ if a_i and a_j are completely different.
- $s = 1$ if a_i and a_j are identical.
- s is the ratio of the number of common characters to the total number of characters in the longer string.

2 Methods

Figure 1 shows the steps in merging databases using the record linkage approach. The steps taken include pre-processing, generating pairs, compare pairs, score pairs, and finally link data. All these stages are carried out using the record linkage toolkit library which is implemented in the python programming language.

Fig. 1. Record Linkage Steps

- Some of these stages can be explained as follows:
- Pre-processing**

- **Generate Pairs** (code snippet)
- **Compare Pairs** (code snippet)
- **Score Pairs** (code snippet) the compare pairs stage. By giving a certain threshold value (Θ), the correct score is (code snippet)
- **Link Data** (code snippet)

3 Results and Discussion

3.1 Pre-Processing Step

The pre-processing stage is the most important stage. At this stage, uniform formatting and field selection are carried out for further processing. Not all fields in both data sources will be used. Only 5 pieces of field information will be used, namely username, name, place of birth, date of birth, and gender. At this stage, it is done to change the string in the name and place of birth fields to lowercase. In addition, if there is more than one white space, it will be deleted and made into one white space only. The following program code segments are used to perform pre-processing stages which are implemented on both dataset sources.

```

1 df = pd.read_csv('data.csv')
2 df = df[['username', 'name', 'place_of_birth', 'date_of_birth', 'gender']]
3 df['name'] = df['name'].str.lower()
4 df['place_of_birth'] = df['place_of_birth'].str.lower()
5 df['place_of_birth'] = df['place_of_birth'].str.replace(' ', '_')
6 df['place_of_birth'] = df['place_of_birth'].str.replace('-', '_')
7 df['place_of_birth'] = df['place_of_birth'].str.replace('.', '_')
8 df['place_of_birth'] = df['place_of_birth'].str.replace(' ', '_')
9 df['place_of_birth'] = df['place_of_birth'].str.replace('-', '_')
10 df['place_of_birth'] = df['place_of_birth'].str.replace('.', '_')

```

3.2 Generate Pairs

At this stage of generating pairs, indexing and blocking processes will be carried out. This stage will reduce the number of candidate record pairs, because not all records will be compared. Only records that have a high degree of similarity will be used for further processing. Without using blocking, for example, the number of records is 500, a pair of 500 x 500 record pairs or 250,000 will be generated. Of course, this will make computing more complex. By using indexing and blocking, the number of records can be reduced. Using the recordlinkage.Index() function will produce indexing objects obtained from 2 datasets, in this case dfA which comes from academic data, and dfB which comes from research and community service data.

```

1 indexA = recordlinkage.Index(dfA)
2 indexB = recordlinkage.Index(dfB)
3 indexAB = recordlinkage.Index(indexA, indexB)
4 pairs = indexAB.block(0, 1, 2)

```

The important notation used to generate blocked pairs for a column is to call the block() function. After the indexer object is created, the indexer.index() method will be executed on

the two processed dataframes. Generate pairs will generate candidate_links containing multiindex information from both datasets.

3.3 Compare Pairs

At this stage a number of fields will be compared the level of similarity using the Jaro-Winkler similarity function. This method produces a range of values between 0 to 1. A value of 0 means that the two strings are not at all similar, while a value of 1 means that the two strings are the same value. The larger the resulting value, the more similar the two strings are. The following is a segment of program code to compare records.

```
6 df1 = df1[['Name', 'Address', 'City', 'State', 'Zip']]
6 df2 = df2[['Name', 'Address', 'City', 'State', 'Zip']]
6 df1['Name'] = df1['Name'].str.strip()
6 df2['Name'] = df2['Name'].str.strip()
6 df1['Address'] = df1['Address'].str.strip()
6 df2['Address'] = df2['Address'].str.strip()
6 df1['City'] = df1['City'].str.strip()
6 df2['City'] = df2['City'].str.strip()
6 df1['State'] = df1['State'].str.strip()
6 df2['State'] = df2['State'].str.strip()
6 df1['Zip'] = df1['Zip'].str.strip()
6 df2['Zip'] = df2['Zip'].str.strip()
```

3.4 Score Pairs

```
df1['Name'] = df1['Name'].str.strip()
df2['Name'] = df2['Name'].str.strip()
df1['Address'] = df1['Address'].str.strip()
df2['Address'] = df2['Address'].str.strip()
df1['City'] = df1['City'].str.strip()
df2['City'] = df2['City'].str.strip()
df1['State'] = df1['State'].str.strip()
df2['State'] = df2['State'].str.strip()
df1['Zip'] = df1['Zip'].str.strip()
df2['Zip'] = df2['Zip'].str.strip()
```

3.5 Link Data

The data link is the final stage in a series of record linkage processes. This stage is tasked with merging or joining two datasets. The first step is to carry out the process to find duplicate records. After that, the duplicated data will be removed, and the results will be added in a new dataset as a result of the merger. The following is a segment of program code to perform the merging process.

```
df1 = df1[['Name', 'Address', 'City', 'State', 'Zip']]
df2 = df2[['Name', 'Address', 'City', 'State', 'Zip']]
df1['Name'] = df1['Name'].str.strip()
df2['Name'] = df2['Name'].str.strip()
df1['Address'] = df1['Address'].str.strip()
df2['Address'] = df2['Address'].str.strip()
df1['City'] = df1['City'].str.strip()
df2['City'] = df2['City'].str.strip()
df1['State'] = df1['State'].str.strip()
df2['State'] = df2['State'].str.strip()
df1['Zip'] = df1['Zip'].str.strip()
df2['Zip'] = df2['Zip'].str.strip()
```

Figure 2 is the result of the merging of two datasets. A total of 444 records were merged, by eliminating the same records. Figure 2 provides information that after several stages of

deduplication are carried out, the results will be obtained in the form of 1 single dataset as a combination of two datasets. The formed dataset contains data that has no duplication.

Fig. 2. Merging Process Results

4 Conclusion

As future research, a real-time data merging process can be developed, so changes to each dataset can produce a single dataset that can be used directly. Another aspect that can be implemented is to test the performance of the results of duplication using several parameters to determine the quality of the model that has been developed.

We thank all those who have supported the publication of this article.

Dear Participant

The 7th **ICENIS 2022**

The international conference on energy, environment, epidemiology, and information system (7th **ICENIS 2022**) has been held on Tuesday-Wednesday (9th - 10th August 2022) via the Online Zoom application. Thank you for your kind support of this conference. Your participation is very valuable to our conferences. Attached is the material from the keynote speakers on the second day of the 7th **ICENIS 2022**.

International Conference on Energy, Environment,
Epidemiology, and Information System

LETTER OF ACCEPTANCE

Author : M. Miftakul Amin, Adi Sutrisman, Yevi Dwitayanti
Code : IS
Topic/theme : Information System
Title : Master Data Management using Record Linkage Toolkit for Integrating Lecturer Master Data
Virtual Account : 8855112012222397
Bank : Bank Mandiri
Amount of Payment : Rp 2.000.000

Dear Author,

Congratulation,

After the pre peer-review process, we are pleased to inform you that your paper has been accepted by the Scientific Committee of the International Conference on the Energy, Environment, Epidemiology, and Information System 2022 (7th ICENIS 2022) to be presented at the Conference. The conference will be held online from 9-10 August 2022. Please note, that this Letter of Acceptance is also considered an Invitation Letter.

The conference fee can be paid with the Virtual Account above. We will appreciate it if you make a payment before July 25th. Send your proof of payment to icenis2022@live.undip.ac.id. Guideline of payment can be seen at this link <http://bit.ly/GuidelinesForPaymentICENIS>.

The review of full paper will be processed after the payment. When you got the result from the reviewer, the revised manuscript has to be uploaded before the conference date and the result of similarity using Turnitin software has also to be uploaded. If you have difficulties, you may send the documents by email to make them secure.

Selected papers are possible to be published in the proceeding of E3S Web of Conference (Indexed by Clarivate Web of Science) and AIP (Indexed by SCOPUS), or special issue of the journals*): Environment and Ecology Research (indexed by SCOPUS Q3), Civil Engineering and Architecture (SCOPUS Indexed Q2), Food Science and Technology (Indexed by SCOPUS Q4), Mathematics and Statistics (Indexed by SCOPUS Q4), Universal Journal of Agricultural Research (Indexed by SCOPUS Q3), International Journal of Human Movement and Sports Sciences (Indexed by SCOPUS Q3). Please note that this LoA is not a guarantee that your paper will be published in the journals/proceedings. Therefore, you have to follow the revision process, a timeline of submission, and the guideline. We will be left behind for late submission. Your collaboration will be very helpful to the publication process.

We are looking forward to welcoming you to our conference.

Semarang, July 19th 2022

Sincerely,
Organizing Committee of ICENIS 2022
Chairperson,

Dr. Rudi Warsito, S.Si, M.Si.
