-..... OPERATING SUPPLY VOLTAGE

UP TO 46 V
TOTAL DC CURRENT UP TO 4 A
LOW SATURATION VOLTAGE
OVERTEMPERATURE PROTECTION
LOGICAL "0" INPUT VOLTAGE UP TO 1.5 V
( HIGH NOISE IMMUNITY )

## DESCRIPTION

The L298 is an integrated monolithic circuit in a 15lead Multiwatt and PowerSO20 packages. It is a high voltage, high current dual full-bridge driver designed to accept standard TTL logic levels and
drive inductive loads such as relays, solenoids, DC and stepping motors. Two enable inputs are provided to enable or disable the device independently of the input signals. The emitters of the lower transistors of each bridge are connected together and the corresponding external terminal can be used for the con-

## APPLICATION INFORMATION (Refer to the block diagram)

### 1.1. POWER OUTPUT STAGE

The L298 integrates two power output stages (A ; B). The power output stage is a bridge configuration and its outputs can drive an inductive load in common or differenzial mode, depending on the state of the inputs. The current that flows through the load comes out from the bridge at the sense output : an external resistor (Rsa ; Rsb.) allows to detect the intensity of this current.

### 1.2. INPUT STAGE

Each bridge is driven by means of four gates the input of which are $\ln 1 ; \ln 2 ; E n A$ and $\ln 3 ; \ln 4$; EnB. The In inputs set the bridge state when The En input is high ; a low state of the En input inhibits the bridge. All the inputs are TTL compatible.

## 2. SUGGESTIONS

A non inductive capacitor, usually of 100 nF , must be foreseen between both Vs and Vss, to ground,
as near as possible to GND pin. When the large
The brake function (Fast motor stop) requires that This circuit drives bipolar stepper motors with winding currents up to 2 A . The diodes are fast 2 A types.

$\mathrm{R}_{\mathrm{s} 1}=\mathrm{R}_{\mathrm{s} 2}=0.5 \Omega$
D1 to D8 $=2 \mathrm{~A}$ Fast diodes

$$
\left\{\begin{array}{l}
\mathrm{V}_{\mathrm{F}} \leq 1.2 \mathrm{~V} @ \mathrm{I}=2 \mathrm{~A} \\
\mathrm{trr} \leq 200 \mathrm{~ns}
\end{array}\right.
$$

capacitor of the power supply is too far from the IC, a second smaller one must be foreseen near the L298.
The sense resistor, not of a wire wound type, must be grounded near the negative pole of Vs that must be near the GND pin of the I.C.
Each input must be connected to the source of the driving signals by means of a very short path.
Turn-On and Turn-Off : Before to Turn-ON the Supply Voltage and before to Turn it OFF, the Enable input must be driven to the Low state.

## 3. APPLICATIONS

Fig 6 shows a bidirectional DC motor control Schematic Diagram for which only one bridge is needed. The external bridge of diodes D1 to D4 is made by four fast recovery elements (trr $\leq 200$ nsec) that must be chosen of a VF as low as possible at the worst case of the load current.
The sense output voltage can be used to control the current amplitude by chopping the inputs, or to provide overcurrent protection by switching low the enable input.
the Absolute Maximum Rating of 2 Amps must never be overcome.
When the repetitive peak current needed from the load is higher than 2 Amps, a paralleled configuration can be chosen (See Fig.7).
An external bridge of diodes are required when inductive loads are driven and when the inputs of the IC are chopped; Shottky diodes would be preferred.
This solution can drive until 3 Amps In DC operation and until 3.5 Amps of a repetitive peak current.
On Fig 8 it is shown the driving of a two phase bipolar stepper motor; the needed signals to drive the inputs of the L298 are generated, in this example, from the IC L297.
Fig 9 shows an example of P.C.B. designed for the application of Fig 8.
Figure 8 : Two Phase Bipolar Stepper Motor Circuit.
Fig 10 shows a second two phase bipolar stepper motor control circuit where the current is controlled by the I.C. L6506.
