## **CHAPTER V**

## CONCLUSION AND SUGGESTION

## 5.1 Conclusion

The followings are the stages in writing short story using Research and Methodology method modified by Sukmadinata (2005). The stages are Preliminary study, development of the product, and final product testing. Based on the writer's literature study, there are some steps to write short story by Rampan (1995, p.54). First, making the outline of the short story by deciding the elements of short story such as theme, characters, plot, setting etc. Next, developing the structure of short story, it can be done by free writing and then revised to be a good draft. For development of the product, the writer requested some comments and suggestions from the experts in limited and wider testing to improve the short story. There were still some comments and suggestions in the short story. Most of comments and suggestions were more explanation about the character's description and the situation in the story for the content. And then, for the language itself, there were some comments and suggestions about the grammar and vocabularies. After getting the comments and suggestions, the writer revised it to be a good final product. Finally, the writer produced the short story in book version and did dissemination through Wattpad and shared to random people are 17-23 years old. The short story is better to contain 750-10.000 words, so the reader can read and catch the information easily. Reading some short stories or fiction stories from the other authors is needed to be the references for the short story.

## 5.2 Suggestions

- 1. The writer expects the future researchers to use final product testing to make the product better because there will be more testing from more experts.
- 2. The writer expects the future researchers are able to find more interesting way

or application to disseminate the product.

3. The writer expects the future researches are able to use Wattpad or more interesting application not only for dissemination, but also for testing.
